Translation
of the passage from line 20 to line 28 on page 11 of the French Patent 2 820 630 (Benazzouz Karim)

...

With respect to the Figures 14a, 14b and 14c, a rod or spindle is illustrated which corresponds equally to the invention. The spindle (40) represented here is, for example, a rod with a trocar tip or a lanceolated tip. It is equally provided with a central bore (41) and is also provided with through-holes (42) at the level of its lateral wall, which permits the establishment of a communication of the central bore (41) with the outside. Figure 14a illustrates the spindle of the type in question here, which is fixed by simple pinching on the end of the ancillary injection means. Figure 14b shows a view comparable to that of Figure 14a; however, the spindle is fixed here on the ancillary means by screwing. And Figure 14c is a view analogous to Figures 14a and 14b; however, it represents the spindle fixed on the ancillary means by a projection in cooperation with an annular groove.
